Understanding Stroke: An Overview

What Is a Stroke?

A stroke occurs when blood flow to a part of the brain is interrupted or reduced, depriving brain tissue of oxygen and nutrients. Within

minutes, brain cells begin to die, causing potential lasting neurological damage or death. Strokes are medical emergencies that require immediate attention.

Types of Stroke

There are three primary types of strokes: 1. Ischemic Stroke: Caused by a blood clot blocking a blood vessel in the brain (accounts for approximately 87% of strokes). 2. Hemorrhagic Stroke: Caused by bleeding in or around the brain due to a ruptured blood vessel. 3. Transient Ischemic Attack (TIA): Often called a mini-stroke, it's a temporary blockage that resolves without causing permanent damage but indicates increased stroke risk.

Common Symptoms of a Stroke

Recognizing the symptoms of a stroke early can save lives and improve outcomes. Key signs include: - Sudden numbness or weakness, especially on one side of the body - Sudden confusion or difficulty speaking or understanding speech - Sudden vision problems in one or both eyes - Sudden dizziness, loss of balance, or coordination - Sudden severe headache with no known cause

Hemorrhagic Stroke (13% of cases): This results from a weakened blood vessel that ruptures, causing bleeding in the brain. Common causes include high blood pressure, aneurysms, or arteriovenous malformations. 3. Transient Ischemic Attack (TIA): Often called a

"mini-stroke," a TIA involves temporary blockage with symptoms resolving within minutes to hours. While not causing permanent damage, TIAs are warning signs of potential future strokes.
