3. Helps meet building codes and standards, ensuring compliance with safety and performance regulations.
4. Aids in cost estimation and budgeting during the design phase.

Fundamental Concepts in ASHRAE Load Calculation

Heat Balance Approach

At the core of ASHRAE's methodology is the heat balance approach, which involves assessing all heat gains and losses to and from the space. This includes:

1. External heat gains (solar radiation, outdoor air temperature)
2. Internal heat gains (occupants, equipment, lighting)
3. Heat transfer through building envelope (walls, windows, roof)
4. Ventilation and infiltration effects

The Zone Concept

The building space is divided into thermal zones with similar characteristics, simplifying calculations and allowing for tailored HVAC design for each zone.

Design Conditions

The calculations are based on design outdoor conditions (peak

summer and winter temperatures) and indoor comfort criteria (temperature, humidity, air quality).

Step-by-Step Guide to Load Calculation According to ASHRAE 2nd Edition

1. Data Collection and Building Characterization

Gather comprehensive data, including:

1. Building geometry and orientation
2. Construction materials and insulation properties
3. Windows and glazing details
4. Internal heat sources (occupants, equipment)
5. Ventilation requirements
6. Local climate data

1. Calculate External Heat Gains and Losses

Solar Radiation

1. Determine solar heat gain through windows based on orientation, shading devices, and glazing properties.
2. Calculate solar radiation incident on walls and roofs.

Conduction through Building Envelope

1. Use U-values (thermal transmittance) to compute heat transfer through walls, roofs, and floors.

Ventilation and Infiltration

1. Calculate the heat added or removed by outdoor air entering the space, considering building air change rates.

1. Calculate Internal Heat Gains

1. Occupants: heat emitted per person, considering activity level.
2. Lighting: lighting load based on lighting power density and usage hours.
3. Equipment: computers, appliances, manufacturing machines, etc.

1. Determine Internal and External Load Components

1. Sum all gains and losses to find the total cooling and heating loads.
2. For cooling load, focus on heat gains; for heating load, focus on heat losses.
