Sample Multiple Choice Questions in Immunohematology

Below are examples of MCQs with answers and explanations to illustrate the typical questions encountered in this field.

Question 1:

Which blood group system is most commonly associated with hemolytic disease of the newborn?

1. ABO system
2. Rh system
3. Kell system
4. Duffy system

Answer: b. Rh system

Explanation: The Rh system, especially anti-D antibodies, is the most significant in hemolytic disease of the newborn (HDN). Anti-D antibodies cross the placenta and cause hemolysis of fetal red blood cells.

Question 2:

What is the primary antibody involved in the ABO blood group system?

1. IgA
2. IgG
3. IgM
4. IgE

Answer: c. IgM

Explanation: Naturally occurring anti-A and anti-B antibodies are primarily IgM class, which can cause immediate hemolytic reactions if incompatible blood is transfused.

Question 3:

Which of the following tests is used to detect irregular antibodies in a patient's serum?

1. ABO grouping
2. Crossmatching
3. Antibody screening test
4. Direct Coombs test

Answer: c. Antibody screening test

Explanation: The antibody screening test (indirect antiglobulin test) detects irregular antibodies in the recipient's serum that may react with donor red cells.

Question 4:

Which component is most suitable for a patient with thrombocytopenia?

1. Fresh frozen plasma
2. Platelet concentrate
3. Packed red cells
4. Cryoprecipitate

Answer: b. Platelet concentrate

Explanation: Platelet concentrates are used to treat thrombocytopenia to increase platelet count and reduce bleeding risk.

Approaching Multiple Choice Questions in Immunohematology

Strategies for effective answering

1. Read the Question Carefully: Pay close attention to what is being asked, including keywords and qualifiers.
2. Identify Key Concepts: Recognize whether the question pertains to blood group identification, antibody screening, compatibility testing, or disease diagnosis.
3. Eliminate Irrelevant Options: Discard options that are clearly incorrect to narrow your choices.
4. Use Logic and Knowledge: Apply your understanding of immunohematology principles to select the most appropriate answer.
5. Watch for Common Traps: Be cautious of distractors designed to test your depth of knowledge or attention to detail.
6. Review if Time Permits: If uncertain, mark the question and revisit after completing the rest of the test.

Common Patterns and Topics in Immunohematology MCQs

Immunohematology MCQs often focus on key topics such as:

1. Blood group systems (ABO, Rh, Kell, Duffy, Kidd, MNS)
2. Antibody identification and significance
3. Compatibility testing procedures
4. Blood component preparation and storage
5. Transfusion reactions and their management
6. Hemolytic disease of the fetus and newborn

9. Rare blood groups and phenotypes

Recognizing these patterns can help you anticipate questions and prepare more effectively.

Sample Multiple Choice Questions and Detailed Explanations

Below are some representative MCQs covering various aspects of immunohematology, along with thorough explanations to reinforce learning.

Question 1:

Which blood group system is most commonly associated with hemolytic transfusion reactions?

A) MNS system

B) Rh system

C) Lewis system

D) Kell system

Correct Answer: B) Rh system

Explanation:

The Rh blood group system, particularly the presence or absence of the D antigen, is crucial in transfusion medicine. Anti-D antibodies can cause hemolytic transfusion reactions if incompatible blood is transfused. Rh incompatibility is also the primary cause of hemolytic disease of the fetus and newborn (HDFN). While other systems like Kell and MNS can cause alloimmunization, Rh remains the most clinically significant in transfusion reactions.

Question 2:

A patient’s serum reacts strongly with all panel cells, but not with the autocontrol. Which of the following is the most likely explanation?

A) Autoantibody production

B) Alloantibody against transfused blood

C) No antibody present

D) Reagent incompatibility

Correct Answer: B) Alloantibody against transfused blood

Explanation:

A strong reactivity with panel cells and no reactivity with the autocontrol suggests the presence of an alloantibody (antibody formed against foreign antigens, typically after transfusion or pregnancy). The autocontrol tests the patient’s own red cells; if negative, it indicates the antibody is directed against foreign

antigens, not autoantigens. Autoantibodies usually react with the patient’s own cells, leading to positive autocontrol. Reagent issues are less common but should be ruled out if other controls are consistent.

Question 3:

Which of the following blood group antigens is most frequently involved in clinically significant alloantibody formation?

A) Anti-Lea

B) Anti-K

C) Anti-M

D) Anti-P1

Correct Answer: B) Anti-K

Explanation:

Anti-Kell (anti-K) antibodies are among the most clinically significant alloantibodies because they can cause hemolytic transfusion reactions and HDFN. They are frequently encountered in patients who have been exposed to Kell antigens through transfusions or pregnancy. Anti-Lea, Anti-M, and Anti-P1 are less often associated with severe reactions, although they can still be clinically relevant.

Question 4:

During compatibility testing, a crossmatch shows compatibility with donor blood. However, the patient develops a hemolytic reaction after transfusion. Which of the following is the most probable cause?

A) Donor blood was mislabelled

B) The antibody was not detected during screening

C) The antibody was missed due to technical error during testing

D) The patient developed an autoantibody after transfusion

Correct Answer: C) The antibody was missed due to technical error during testing

Explanation:

Hemolytic reactions despite a compatible crossmatch suggest that an alloantibody was not detected during pre-transfusion testing. This can occur due to technical errors, such as inadequate antibody screening, weak antibody expression, or reagent issues. Mislabeling is also possible but less common if proper procedures are followed. Autoantibodies usually cause positive direct antiglobulin tests, but the question emphasizes an antibody not detected initially.

Question 5:

What is the primary purpose of an indirect antiglobulin test (IAT) in immunohematology?

A) Detecting autoantibodies on patient red cells

B) Detecting alloantibodies in patient serum

C) Crossmatching donor and recipient blood directly

D) Identifying blood group antigens on red cells

Correct Answer: B) Detecting alloantibodies in patient serum

Explanation:

The indirect antiglobulin test (IAT) is used to detect alloantibodies in the patient's serum by incubating patient

serum with reagent red cells expressing known antigens. If alloantibodies are present, they will bind to the red cells, and subsequent antiglobulin reagent will detect these complexes. It is a critical step in antibody screening and identification. Direct antiglobulin test (DAT) detects antibodies bound directly to patient cells, whereas crossmatching is a compatibility procedure, not an antibody detection test.

Enhancing Your Skills with Practice

To excel in immunohematology MCQs:

1. Regularly review key blood group systems and their clinical significance.
2. Practice with simulated case scenarios to understand real-world applications.
3. Use reputable question banks and past exam papers.
4. Engage in group discussions or study sessions to clarify doubts.
5. Keep updated with current guidelines and research developments.
